# 工作原理 Principle of Speed Reduction

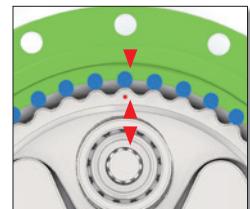

## 【第一减速部】

### ● 行星齿轮减速机构

在用框架部固定KINEX的状态下，通过输入齿轮转动行星齿轮后，与行星齿轮直接连接的偏心轴也随之旋转。

偏心轴 旋转角0°  
Eccentric shaft Rotation angle 0°

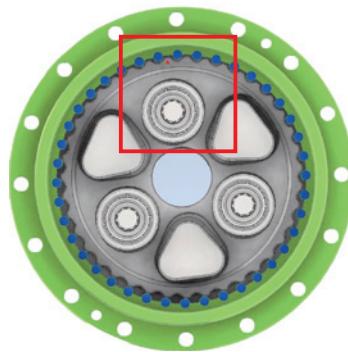

## 【第二减速部】

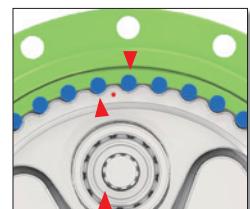

### ● 差动齿轮减速机构

利用偏心轴的旋转，组装在偏心部的轮子进行偏心运动，轮子一边与销子啮合一边旋转。

由于销子比轮子的齿数多1个，当偏心轴转完一圈时，轮子仅转了1齿。支撑偏心轴的输出法兰与轮子同步旋转。

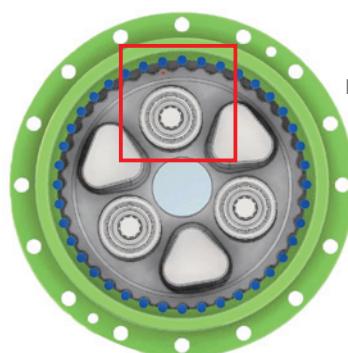

偏心轴 旋转角180°  
Eccentric shaft Rotation angle 180°

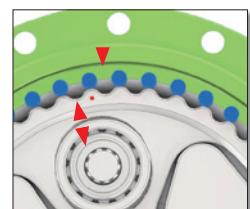

## [1st stage]

### • Planetary gear reduction mechanism

With the KINEX fixed on the frame, when the input gear rotates the planetary gear, the eccentric shaft directly connected to the planetary gear also rotates.

偏心轴 旋转角360°  
Eccentric shaft Rotation angle 360°

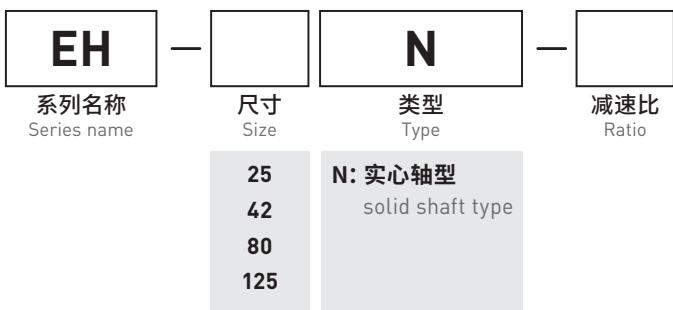

## [2nd stage ]

### • Epicyclic gear reduction

Due to the rotation of the eccentric shaft, the wheel incorporated in the eccentric part moves eccentrically, and the wheel rotates while meshing with the pins. Since there is one more pin than the number of teeth on the wheel, the wheel rotates by one tooth with each rotation of the eccentric shaft, and the output flange that supports the eccentric shaft rotates synchronously with the wheel.
